# Posting Frequency and Pricing in an Online Resale Market 

Yeonju Baik

Korea Institute of Finance
April 20, 2023

Motivation

## Motivation

- Product visibility in online markets can increase traffic and consumer purchases

## Motivation

- Product visibility in online markets can increase traffic and consumer purchases
- Wall Street Journal (2019):

When people are searching for products on Amazon, nearly two-thirds of all product clicks come from the first page of results

## Motivation

- Product visibility in online markets can increase traffic and consumer purchases
- Wall Street Journal (2019):

When people are searching for products on Amazon, nearly two-thirds of all product clicks come from the first page of results

- In many used markets, sellers use posting as a tool to promote their products:

## Motivation

- Product visibility in online markets can increase traffic and consumer purchases
- Wall Street Journal (2019):

When people are searching for products on Amazon, nearly two-thirds of all product clicks come from the first page of results

- In many used markets, sellers use posting as a tool to promote their products:
- Re-posting (도배: 중고나라, Facebook marketplace, Craigslist)

## Motivation

- Product visibility in online markets can increase traffic and consumer purchases
- Wall Street Journal (2019):

When people are searching for products on Amazon, nearly two-thirds of all product clicks come from the first page of results

- In many used markets, sellers use posting as a tool to promote their products:
- Re-posting (도배: 중고나라, Facebook marketplace, Craigslist)

Example

- Question:

■ How does product visibility affect prices in equilibrium?

- Why is reposting commonly observed across many secondhand trading platforms?

## Overview of Research

## Research Question

(1) How does posting frequency relate to a seller's pricing?

- Using theoretical predictions, I infer how sellers compete in price
(2) To what extent is posting frequency responsible for a seller's market power(pricing power)?
(3) How does posting frequency relate to platform's profit?

## Overview of Research

## Research Question

(1) How does posting frequency relate to a seller's pricing?

- Using theoretical predictions, I infer how sellers compete in price
(2) To what extent is posting frequency responsible for a seller's market power(pricing power)?
(3) How does posting frequency relate to platform's profit?

## Overview of Research

## Research Question

(1) How does posting frequency relate to a seller's pricing?

- Using theoretical predictions, I infer how sellers compete in price
(2) To what extent is posting frequency responsible for a seller's market power(pricing power)?
(3) How does posting frequency relate to platform's profit?
- Data: Collect high-frequency data on listings in a unique online cellphone resale platform, "Cetizen"

## Overview of Research

## Research Question

(1) How does posting frequency relate to a seller's pricing?

- Using theoretical predictions, I infer how sellers compete in price
(2) To what extent is posting frequency responsible for a seller's market power(pricing power)?
(3) How does posting frequency relate to platform's profit?
- Data: Collect high-frequency data on listings in a unique online cellphone resale platform, "Cetizen"
- Match price competition model: Using the observed price distribution, I infer how sellers compete in price
- Match the data with model prediction

## Overview of Research

## Research Question

(1) How does posting frequency relate to a seller's pricing?

- Using theoretical predictions, I infer how sellers compete in price
(2) To what extent is posting frequency responsible for a seller's market power(pricing power)?
(3) How does posting frequency relate to platform's profit?
- Data: Collect high-frequency data on listings in a unique online cellphone resale platform, "Cetizen"
- Match price competition model: Using the observed price distribution, I infer how sellers compete in price
- Match the data with model prediction
- Quantify market power: Recover the cost parameter for advertising and calculate markups

## Preview of Results

- Sellers whose post share is higher by $10 \%$, sell at a $6.6 \%$ higher price
- e.g., Galaxy S9 has 10 posts/hr, seller A posts $1 / \mathrm{hr}(10 \%)$, B posts $2 / \mathrm{hr}(20 \%)$, then seller B has $6.6 \%$ higher price than seller A
- In the inferred pricing competition structure, sellers who post less face more elastic consumer demand
- Frequent posters have higher market power in the inferred price competition structure than infrequent posters

## Literature

- Online market
- Seller behavior in the online market: Huang(2021), Jolivet et al.(2016)
■ Rankings: Ursu(2018), Santos et al.(2017), Moshary(2021)
- Models of advertising

■ Butters(1977), Stahl II(1994), McAfee(1994), Haan and Moraga-Gonzalez(2011), Robert and Stahl(1993), Armstrong et al.(2009)

- The role of prominence: Rhodes(2011), Armstrong et al(2009), Chen and He(2011), Armstrong, Zhou(2011), Armstrong, Vickers(2022)
- Testing between search models

■ De Los Santos(2012), Hong and Shum(2006), Honka and Chintagupta(2017)

## Literature

- Testing between search models

■ De Los Santos(2012), Hong and Shum(2006), Honka and Chintagupta(2017)

## $\rightarrow$ Contributions

- First paper to test interaction framework(Armstrong, Vickers(2022)) prediction
- First paper to provide empirical evidence regarding how posting frequency is related to market price

## Outline

(1) Data
(2) Model
(3) Testing Models
(4) Quantifying Market Power

## Data: Used Cellphone

- Used cellphone trading platform called Cetizen
- Accounts for $20 \%$ of used cell phone market trades

■ Listings from Feb. 5th-Aug. 29th (2020) Samsung and Apple

- No extra fee, no algorithm Data cleaning
- Postings are listed in the order of the arrival
- A number of sellers provide wide range of products

■ Repeated posting (도배): Advertising effort

- Re-posting: Renewing an old posting
- Duplicate posting: Posting the same thing repeatedly

## Repeated Posting: Re-Posting

- After sellers post the product, they have a choice to renew
- Sellers do not change the price frequently when they repost

[^0]
## Repeated Posting: Duplicated Posting

## Empirical Fact 1

- Repeated posting increases the probability of a sale (i post, j seller k product)

Table 1: Product Sales

|  | Sold | Sold |
| :---: | :---: | :---: |
| \# Repeated/Day(avg.) | $0.0936^{* * *}$ | $0.0901^{* * *}$ |
|  | $(0.00890)$ | $(0.00878)$ |
| Model share(avg.) | -0.356 | -0.168 |
|  | $(0.495)$ | $(0.557)$ |
| \# Seller Freq/Day(avg.) | $0.000133^{* * *}$ | $0.000149^{* * *}$ |
|  | $(0.0000233)$ | $(0.0000284)$ |
| Daygap(avg.) |  | $0.000484^{*}$ |
|  |  | $(0.000226)$ |
| N | 84849 | 52225 |
| $\mathrm{R}-\mathrm{sq}$ | 0.011 | 0.015 |

- Unit of analysis: posting with a unique description
- $Z_{i j t}$ (controls): Price Ratio (\$), memory size, conditions, warranty

## Empirical Fact 2

- Listings that are posted more have higher prices

Table 2: Price and the Number of Postings

| Variable | Price(\$) | Price $(\$)$ | Price $(\$)$ |
| :--- | :--- | :--- | :--- |
| \# Repeated | $0.168^{* * *}$ | $0.155^{* * *}$ | $0.144^{* * *}$ |
|  | $(0.0276)$ | $(0.0267)$ | $(0.0272)$ |
| \# Model $\times$ date $\times$ hour | $-0.285^{* *}$ | $-0.304^{* *}$ | $-0.425^{* * *}$ |
|  | $(0.102)$ | $(0.102)$ | $(0.102)$ |
| \# Seller $\times$ date $\times$ hour |  | $0.0438^{* * *}$ | -0.00114 |
|  |  | $(0.0126)$ | $(0.0215)$ |
| \# Seller $\times$ date $\times$ hour $\times$ model |  |  | $1.743^{* *}$ |
|  |  |  | $(0.615)$ |
| Const | YES | YES | YES |
| Controls ${ }^{1}$ | YES | YES | YES |
| Model FE | YES | YES | YES |
| Month FE | YES | YES | YES |
| Seller FE | YES | YES | YES |
| N | 38965 | 38965 | 38965 |
| R-sq | 0.941 | 0.941 | 0.941 |

* Unit of analysis is a posting with a unique description, Only include listings from the sellers who post more than 20 postings per 1 hour ( $>20 / h r$ )
${ }^{1}$ Controls: machine condition, warranty, Unit of analysis is each listing

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?
- We want to understand how sellers are competing

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?
- We want to understand how sellers are competing
- This depends on how consumers are searching: Competitors are the one who are included in the same consideration set

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?
- We want to understand how sellers are competing
- This depends on how consumers are searching: Competitors are the one who are included in the same consideration set
- Posting changes how consumer form its consideration set

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?
- We want to understand how sellers are competing
- This depends on how consumers are searching: Competitors are the one who are included in the same consideration set
- Posting changes how consumer form its consideration set

■ Two competing models: Independence, nested

## Empirical Observations

- Why are the sellers who post more able to charge higher prices?
- We want to understand how sellers are competing
- This depends on how consumers are searching: Competitors are the one who are included in the same consideration set
- Posting changes how consumer form its consideration set

■ Two competing models: Independence, nested

- Model (Armstrong, Vickers(2022))

■ Assumption: Homogeneous good, competing in price (mixed pricing strategy)
■ (Consumer's) Consideration probability: Reach $\left(\sigma ; \sigma_{1}, \sigma_{2}, \sigma_{3}\right)$

## Model: idea

- Each posting by seller i enters the market with the rate $\sigma_{i}$ ( $\sigma_{1} \leq \cdots \leq \sigma_{n}$ (poisson))
- Frequency of meeting any seller: $\lambda$
- Consumer considers N options on the first page

Model: idea
$P\left(\sigma_{n}\right.$ enters within N elements $\left.\mid \sigma_{1}\right)$

## $P\left(\sigma_{n}\right.$ enters within N elements $\left.\mid \sigma_{1}\right)$

## Model: idea

$$
P\left(\sigma_{n} \text { enters within } \mathrm{N} \text { elements } \mid \sigma_{1}\right)
$$

- $S_{N}$ : the time t until N postings enter the market $(\operatorname{Gamma}(N, \lambda))$
- $X_{n}(t)$ : time t elapsed until seller n enter $\left(\operatorname{Exp}\left(\sigma_{n}\right)\right)$
$P\left(\sigma_{n}\right.$ enters within N elements $\left.\mid \sigma_{1}\right)=$

$$
\begin{aligned}
\int_{0}^{\infty} P\left(S_{N}=t\right) P\left(X_{n} \leq t\right) d t & =\int_{0}^{\infty} \frac{\lambda^{N} z^{N-1} e^{-\lambda z}}{(N-1)!}\left(1-e^{-\sigma_{n} z}\right) d z \\
& =1-\frac{\lambda^{N}}{\left(\lambda+\sigma_{n}\right)^{N}}
\end{aligned}
$$

## Model: Starting from the list

- If $N=1$, meeting seller $\mathrm{n}: \frac{\sigma_{n}}{\lambda+\sigma_{n}}$

## Model: Starting from the list

- If $N=1$, meeting seller $\mathrm{n}: \frac{\sigma_{n}}{\lambda+\sigma_{n}}$
- If N gets larger...

## Model: Starting from the list

- If $N=1$, meeting seller $\mathrm{n}: \frac{\sigma_{n}}{\lambda+\sigma_{n}}$
- If N gets larger...

Figure 1: Meeting probability

## Potential Models of Seller Pricing Competition

- Simple case: 3 seller competition

■ Sellers: Reach $\left(\sigma_{1}, \sigma_{2}, \sigma_{3}\right)$
■ Consumers: $\alpha_{1}, \alpha_{12}, \cdots$
(1) Independent (Random match)

Figure 2: Independent Structure

- Consumers choose the product at the top of the list
- $P($ Large $\sigma \mid$ Small $\sigma)=P($ Large $\sigma)$

## Potential Models of Seller Pricing Competition

(2) Nested Structure (Extensive search)

Figure 3: Nested Structure

## Nested structure

- Compare the options in the list
- The probability is Not independent across the sellers
- $P($ Large $\sigma \mid$ Small $\sigma)=1$

## Potential Models of Seller Pricing Competition

(2) Nested Structure (Extensive search)

Figure 3: Nested Structure

- Compare the options in the list
- The probability is Not independent across the sellers
- $P($ Large $\sigma \mid$ Small $\sigma)=1$
- Key intuition: In nested model, consumers who see small-reach sellers already saw the big-reach sellers
$\rightarrow$ Small sellers face elastic demand

## Model Predictions

- Model predictions why

## Model Predictions

- Model predictions
(1) In the independent structure, the minimum price is the same across the sellers, maximum price increases
(2) In the nested structure, the price supports of each seller increase by the size of $\sigma$

## Model Predictions

- Model predictions
(1) In the independent structure, the minimum price is the same across the sellers, maximum price increases
(2) In the nested structure, the price supports of each seller increase by the size of $\sigma$
- Two tests:
- Sanity check: First order stochastic dominance price distributions
- Test between two pricing models: Minimum price

Figure 4: Independent Structure
Figure 5: Nested Structure

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(C) Using the model, quantify seller's market power (pricing power)

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.
$\rightarrow$ To do so

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.
$\rightarrow$ To do so
- Check model assumptions

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.
$\rightarrow$ To do so
- Check model assumptions
- Calculate Key components

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.
$\rightarrow$ To do so
- Check model assumptions
- Calculate Key components
- Compare model predictions

## Applying Model Predictions to Data

(1) Identify which of the two models better fits the data
(2) Using the model, quantify seller's market power (pricing power)

- Why two models? Difference in demand price elasticity lead to difference in markups: The ability to charge price premium
- It can show how much each seller can enjoy by posting more than competitors.

## $\rightarrow$ To do so

- Check model assumptions
- Calculate Key components
- Compare model predictions
- Compare the two competing price competition models
- Statistical tests are conducted on each cellphone model (Galaxy S9, iPhone 10, etc.)

## Applying Model Predictions to Data

- Check model assumptions

## Applying Model Predictions to Data

- Check model assumptions
(c) Product homogeneity assumption
$\rightarrow$ Several assumptions are needed
- Consumers are homogeneous in utility (Wildenbeest (2011))
- Observable characteristics are additively separable (Wildenbeest (2011), Haile,Hong,Shum (2003))
- Sellers are competing with residual price:
( $i$ : listing, $k$ : model, $t$ : market)

$$
\begin{aligned}
p_{i k t} & =\delta_{i k t}+\epsilon_{i k t} \\
& =Q T_{i k t} \beta_{1}+G R_{i k t} \beta_{2}+\text { Size }_{i k t} \beta_{3}+\gamma_{k}+\text { Month FE }+\epsilon_{i k t} \\
\hat{p}_{i k t} & =\hat{\gamma}_{k}+\hat{\epsilon}_{i k t}
\end{aligned}
$$

## Applying Model Predictions to Data

- Check model assumptions
(1) Product homogeneity assumption
$\rightarrow$ Several assumptions are needed
■ Consumers are homogeneous in utility (Wildenbeest (2011))
■ Observable characteristics are additively separable (Wildenbeest (2011), Haile,Hong,Shum (2003))
- Sellers are competing with residual price:
( $i$ : listing, $k$ : model, $t$ : market)

$$
\begin{aligned}
p_{i k t} & =\delta_{i k t}+\epsilon_{i k t} \\
& =Q T_{i k t} \beta_{1}+G R_{i k t} \beta_{2}+\text { Size }_{i k t} \beta_{3}+\gamma_{k}+\text { Month FE }+\epsilon_{i k t} \\
\hat{p}_{i k t} & =\hat{\gamma}_{k}+\hat{\epsilon}_{i k t}
\end{aligned}
$$

(2) Mixed pricing strategy assumption

- Rank reversal statistics (Chandra, Tappata(2011))
- Similar to the literature

## Construction of Reach $(\sigma)$

- Reach $(\sigma)$ : Matching chance for each seller
- Hour: Frequency of listings
- e.g., Galaxy S9 posted $10 / \mathrm{hr}$, seller A posts $2 / \mathrm{hr}=20 \%$
- Robustness check: Alternative definition of $\sigma$
- Posting share of a seller measured in one month window
- Posting of each title measured in 1 week window
- Classify sellers into three groups based on the size of $\sigma$

## Construction of Reach $(\sigma)$

- Reach $(\sigma)$ : Matching chance for each seller
- Hour: Frequency of listings
- e.g., Galaxy S9 posted $10 / \mathrm{hr}$, seller A posts $2 / \mathrm{hr}=20 \%$
- Robustness check: Alternative definition of $\sigma$
- Posting share of a seller measured in one month window
- Posting of each title measured in 1 week window
- Classify sellers into three groups based on the size of $\sigma$

Table 3: Construction of $\sigma$ Group

| Seller tercile | $\sigma$ (mean) | $\sigma$ (median) | $\sigma$ (std.) |
| :---: | :---: | :---: | :---: |
| Group 1 | 0.134 | 0.128 | 0.048 |
| Group 2 | 0.224 | 0.209 | 0.074 |
| Group 3 | 0.350 | 0.320 | 0.155 |

## Step 1: Stochastic Monotonicity Test

- Step 1: Stochastic Monotone (FOSD) (Chetverikov et al.(2020))
- $H_{0}$ : Price distributions increase wrt. $\sigma$
- Cannot reject $H_{0}$ : Sanity check test V

Table 4: Step 1 Result: Galaxy S9

| Samples | Galaxy S9 |
| :---: | :---: |
| April, prof. | 1.23 |
|  | $(0.17)$ |
| July, prof. | 0.99 |
|  | $(0.5)$ |
| April, prof., brand $>0.8$ | 1.45 |
|  | $(0.06)$ |
| April, prof., brand $<0.6$ | 0.78 |
|  | $(0.70)$ |
| Whole data | 0.53 |
|  | $(1.00)$ |
| p-value mean | 0.354 |
| Criterion p-value | 0.025 |

- Numbers are T stats of the non-parametric test, p-value in the parentheses.
- Prof.: The sellers who sell more than 5 models within 1 month
- Unit of analysis: Unique listing

## Step 2: Quantile Testing

- Step 2: Quantile test (Wilcox et al.(2014))
- Group sellers into 3 by $\sigma$ Reach
- Compare the quantiles

$$
\begin{equation*}
H_{0}: \hat{p}_{i q}-\hat{p}_{j q}=0 \tag{1}
\end{equation*}
$$

- Overall: Nested Structure ${ }^{2}$

■ Some heterogeneity across cellphone models, which depends on market thickness

## Other grouping Other cellphone models Market thickness

Table 5: Step 2 Result: Galaxy S9, July

|  | Group1 | Group3 | Diff. | p-value |
| :---: | :---: | :---: | :---: | :---: |
| $p_{0.01}$ | 0.103 | 0.154 | -0.051 | 0.0000 |
|  |  |  | $(-0.057,-0.044)$ |  |
| $p_{0.05}$ | 0.145 | 0.168 | -0.023 <br> $(-0.032,-0.017)$ <br> $p_{0.1}$ | 0.158 |
|  |  | 0.183 | -0.025 <br> $(-0.034,-0.019)$ | 0.0000 |
| n | 976 | 976 |  |  |

## Step 2: Quantile Testing

- Step 2: Quantile test (Wilcox et al.(2014))
- Group sellers into 3 by $\sigma$ Reach
- Compare the quantiles

$$
\begin{equation*}
H_{0}: \hat{p}_{i q}-\hat{p}_{j q}=0 \tag{1}
\end{equation*}
$$

- Overall: Nested Structure ${ }^{2}$

■ Some heterogeneity across cellphone models, which depends on market thickness

Other grouping Other cellphone models Market thickness

Table 5: Step 2 Result: Galaxy S9, July

|  | Group1 | Group3 | Diff. | p-value |
| :---: | :---: | :---: | :---: | :---: |
| $p_{0.01}$ | 0.103 | 0.154 | -0.051 | 0.0000 |
|  |  |  | $(-0.057,-0.044)$ |  |
| $p_{0.05}$ | 0.145 | 0.168 | -0.023 <br> $(-0.032,-0.017)$ | 0.0000 |
| $p_{0.1}$ | 0.158 | 0.183 | -0.025 <br> $(-0.034,-0.019)$ | 0.0000 |
| n | 976 | 976 |  |  |

- Takeaway: Min. price for group 3 is larger
${ }^{2}$ Joint testing across various sub samples (DiCiccio et al.(2020))

## Robustness Check: Quantile Regression

- Quantile regression: (in general) Nested structure

$$
\begin{equation*}
p_{i m t}=\delta_{q} \sigma_{i m}+\gamma_{t}+\mu_{m}+u_{q, i m t} \tag{2}
\end{equation*}
$$

Table 6: Quantile Regression

| $\tau$ | Estimate of $\delta$ |
| :---: | :---: |
| 0.05 | $56.28^{* * *}$ |
|  | $(3.203)$ |
| 0.1 | $53.04^{* * *}$ |
|  | $(4.624)$ |
| 0.5 | $59.84^{* * *}$ |
|  | $(3.592)$ |
| 0.9 | $41.15^{* * *}$ |
|  | $(4.254)$ |
| 0.95 | $29.90^{* * *}$ |
|  | $(5.557)$ |
| No. Models | 14 |
| Month FE | 0 |
| No. Observations | 23098 |

■ seller $i$, market $t$, model $m$

- $p_{\text {imt }}$ : price, $\gamma_{t}$ : month FE, $\mu_{m}$ : model FE

■ Unit of analysis: Average weekly price of a seller

## Market Power: Price Competition Structure

- To what extent is advertising responsible for a seller's market power?
- Assume the following
(1) Sellers form beliefs about price distributions and $\sigma$ distributions
(2) Based on beliefs and the advertising cost, a seller decides $\sigma$
(3) Compete in price, $F(p \mid \sigma)$
- Assumption: Input market is competitive (same input cost), difference in implicit cost for posting

## Market Power: Price Competition Structure and Intuition

Figure 6: Posting Decision

## Market Power: Price Competition in Nested Structure

- Compete with the firms that are posting more frequently

## Market Power: Price Competition in Nested Structure

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$
- Nested structure

$$
\pi_{2}\left(p, \sigma_{2}\right)=\underbrace{p\left(1-F_{3}(p)\right)}_{\text {Marginal revenue }}(\left(\sigma_{2}-\sigma_{1}\right)+\sigma_{1} \underbrace{\left(1-F_{1}(p)\right)}_{\sigma<\sigma_{2}})-c\left(\sigma_{2}\right)
$$

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$
- Nested structure

$$
\pi_{2}\left(p, \sigma_{2}\right)=\underbrace{p\left(1-F_{3}(p)\right)}_{\text {Marginal revenue }}(\left(\sigma_{2}-\sigma_{1}\right)+\sigma_{1} \underbrace{\left(1-F_{1}(p)\right)}_{\sigma<\sigma_{2}})-c\left(\sigma_{2}\right)
$$

- The cost of advertising: $c\left(\sigma_{2}\right)=\frac{1}{2} \sigma_{2}^{2} w_{2}$
- $\sigma_{2}$ : size of reach, $w_{2}$ : cost parameter

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$
- Nested structure

$$
\pi_{2}\left(p, \sigma_{2}\right)=\underbrace{p\left(1-F_{3}(p)\right)}_{\text {Marginal revenue }}(\left(\sigma_{2}-\sigma_{1}\right)+\sigma_{1} \underbrace{\left(1-F_{1}(p)\right)}_{\sigma<\sigma_{2}})-c\left(\sigma_{2}\right)
$$

- The cost of advertising: $c\left(\sigma_{2}\right)=\frac{1}{2} \sigma_{2}^{2} w_{2}$
- $\sigma_{2}$ : size of reach, $w_{2}$ : cost parameter

$$
(\text { Nested }): M R=p\left(1-F_{3}(p)\right)=c^{\prime}\left(\sigma_{2}\right)=w_{2} \sigma_{2}=\mathrm{MC}
$$

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$
- Nested structure

$$
\pi_{2}\left(p, \sigma_{2}\right)=\underbrace{p\left(1-F_{3}(p)\right)}_{\text {Marginal revenue }}(\left(\sigma_{2}-\sigma_{1}\right)+\sigma_{1} \underbrace{\left(1-F_{1}(p)\right)}_{\sigma<\sigma_{2}})-c\left(\sigma_{2}\right)
$$

- The cost of advertising: $c\left(\sigma_{2}\right)=\frac{1}{2} \sigma_{2}^{2} w_{2}$
- $\sigma_{2}$ : size of reach, $w_{2}$ : cost parameter

$$
(\text { Nested }): \mathrm{MR}=p\left(1-F_{3}(p)\right)=c^{\prime}\left(\sigma_{2}\right)=w_{2} \sigma_{2}=\mathrm{MC}
$$

- Mixed price strategy: Seller's minimum price ( $L_{2}, 5 \%$ price)

$$
w_{2}=\frac{L_{2}}{\sigma_{2}}
$$

## Market Power: Price Competition in Nested Structure

- Focusing on the choice of an arbitrary seller 2
- Seller 1 and seller 3 are also conducting mixed pricing strategy $\left(F_{1}(p), F_{3}(p)\right)$
- Nested structure

$$
\pi_{2}\left(p, \sigma_{2}\right)=\underbrace{p\left(1-F_{3}(p)\right)}_{\text {Marginal revenue }}(\left(\sigma_{2}-\sigma_{1}\right)+\sigma_{1} \underbrace{\left(1-F_{1}(p)\right)}_{\sigma<\sigma_{2}})-c\left(\sigma_{2}\right)
$$

- The cost of advertising: $c\left(\sigma_{2}\right)=\frac{1}{2} \sigma_{2}^{2} w_{2}$
- $\sigma_{2}$ : size of reach, $w_{2}$ : cost parameter

$$
(\text { Nested }): M R=p\left(1-F_{3}(p)\right)=c^{\prime}\left(\sigma_{2}\right)=w_{2} \sigma_{2}=\mathrm{MC}
$$

- Mixed price strategy: Seller's minimum price ( $L_{2}, 5 \%$ price)

$$
w_{2}=\frac{L_{2}}{\sigma_{2}}
$$

- Use empirical objects: $L_{2}, \sigma_{2}$ are observed

## Market Power: Price Competition in Independent Structure

- Independent structure
- For any arbitrary seller $i$, shares the same minimum price $p_{0}$

$$
\pi_{i}\left(p, \sigma_{i}\right)=\sigma_{i} \underbrace{p_{0}}_{\text {Marginal revenue }}-c\left(\sigma_{i}\right)
$$

$$
\begin{gathered}
\text { (Independent) : } M R=p_{0}=c^{\prime}\left(\sigma_{i}\right)=w_{i} \sigma_{i}=M C \\
w_{i}=\frac{p_{0}}{\sigma_{i}}
\end{gathered}
$$

- Mixed price strategy: Same minimum price (5\% price)
- Use empirical objects: $p_{0}, \sigma_{i}$ are observed

## Estimated Results: Markups

- Markups: $\frac{p-\sigma_{i} w_{i}}{p}$
- Frequent sellers have higher markup in the nested structure

Table 7: Markups in Interaction Structure

| Galaxy S9 (Nested) | Median |
| :---: | :---: |
| Group 1 seller | 0.061 |
| Group 2 seller | 0.128 |
| Group 3 seller | 0.135 |
| iPhone XR (Independent) | Median |
| Group 1 seller | 0.124 |
| Group 2 seller | 0.141 |
| Group 3 seller | 0.084 |

- Takeaway: The sellers who post more have more market power if the interaction structure is nested

## Platform's Return

- Platform's revenue: Commission
- Re-posting increases the probability of sale
- The sellers who repost more have higher prices
- Increases platform's return
- Consumer's welfare would decrease

$$
\begin{equation*}
E\left(p \hat{q}_{\text {sell }} \mid \sigma, X\right)=\int p \hat{q}_{\text {sell }}(p, \sigma) f(p \mid \sigma, X) d p \tag{3}
\end{equation*}
$$

Table 8: One listing expected return, Galaxy S9

| Seller Group | Mean (\$) |
| :---: | :---: |
| Group 1 | 5.718 |
|  | $(1.549)$ |
| Group 2 | 6.082 |
|  | $(2.128)$ |
| Group 3 | 7.32 |
|  | $(2.572)$ |

- Takeaway: Repeated posting can be good for platform

## Conclusion

- Online market sellers' behavior

■ I find that sellers who post more charge higher prices

- The mechanism: Nested interaction structure gives more market power to the frequent posters
■ Thinner markets are likely to show nested structure
- Platform gets higher profit from the sellers who post more

## Thank You!

| A2215 | 0.140 |
| A2221 | 0.140 |

## Step 1: Stochastic Monotonicity Test (Chetverikov(2020))

- The null hypothesis
$H_{0}:$ For each $\mathrm{p} \in P, F_{p \mid \sigma}(p \mid \sigma) \leq F_{p \mid \sigma^{\prime}}\left(p \mid \sigma^{\prime}\right)$ if $\sigma \geq \sigma^{\prime} \quad$ for $\sigma, \sigma^{\prime} \in \Sigma$
- It can be written as following equation

$$
\begin{equation*}
\left.E\left(1\left(p_{i} \leq p\right)-1\left(p_{j} \leq p\right)\right) \operatorname{sign}\left(\sigma_{i}-\sigma_{j}\right) K_{h}\left(\sigma_{i}-\sigma\right) K_{h}\left(\sigma_{j}-\sigma\right)\right) \leq 0 \tag{4}
\end{equation*}
$$

- Simplifying the notation by using

$$
\begin{align*}
& K_{i j, h}(\sigma)=\operatorname{sign}\left(\sigma_{i}-\sigma_{j}\right) K_{h}\left(\sigma_{i}-\sigma\right) K_{h}\left(\sigma_{j}-\sigma\right), \\
& k_{i, h}(\sigma)=\sum_{j=1}^{n}\left(K_{i j, h}(\sigma)-K_{j i, h}(\sigma)\right)=2 \sum_{j=1}^{n} K_{i j, h}(\sigma) \\
& \quad T=\max _{(\sigma, p, h) \in \Sigma_{n} \times p_{n} \times B_{n}} \frac{\sum_{i=1}^{n} k_{i, h}(\sigma) 1\left(p_{i} \leq p\right)}{\left(\sum_{i=1}^{n} k_{i, h}(\sigma)^{2}\right)^{1 / 2}} \tag{5}
\end{align*}
$$

- Critical values are calculated using bootstrap

## Robustness Check: With Only Professional Sellers

- Unit of analysis: Seller monthly average, only professional sellers (who sell more than 5 different models within a month)

Table 12: Quantile Regression: Professional Sellers

| $\tau$ | Estimate of $\delta$ |  |
| :---: | :---: | :---: |
|  | $(1)$ | $(2)$ |
| 0.05 | $56.57^{* * *}$ | $50.89^{* *}$ |
|  | $(10.21)$ | $(18.05)$ |
| 0.1 | $51.87^{* *}$ | $49.47^{* *}$ |
|  | $(17.69)$ | $(18.89)$ |
| 0.5 | $261.8^{* * *}$ | $246.9^{* * *}$ |
|  | $(22.69)$ | $(27.66)$ |
| 0.9 | $245.2^{* * *}$ | $215.1^{* * *}$ |
|  | $(32.44)$ | $(32.52)$ |
| 0.95 | $193.5^{* * *}$ | $181.1^{* * *}$ |
|  | $(29.29)$ | $(38.39)$ |
| No. Models | 14 | 14 |
| Month FE | X | O |
| No. Observations | 23098 | 23098 |

## Robustness Check: Time Gaps

- Unit of analysis: Seller monthly average price

Table 13: Quantile Regression: Time Gaps (hours) between Postings

| $\tau$ | Estimate of $\delta$ |  |
| :---: | :---: | :---: |
|  | $(1)$ | $(2)$ |
| 0.05 | $-0.00574^{* * *}$ | $-0.00618^{* * *}$ |
|  | $(0.00102)$ | $(0.001033)$ |
| 0.1 | $-0.00600^{* * *}$ | $-0.00580^{* * *}$ |
|  | $(0.000665)$ | $(0.000947)$ |
| 0.5 | $-0.00402^{* * *}$ | $-0.00472^{* * *}$ |
|  | $(0.000413)$ | $(0.000404)$ |
| 0.9 | $-0.000180^{*}$ | $-0.002122^{*}$ |
|  | $(0.000710)$ | $(0.000933)$ |
| 0.95 | 0.000159 | -0.00129 |
|  | $(0.00222)$ | $(0.00216)$ |
| No. Models | 14 | 14 |
| Month FE | X | 0 |
| No. Observations | 18335 | 18335 |

## Minimum Price and Independent Case

- If both seller 1 and 2 charge the same minimum $p_{0}$, the profit of the two sellers are $\pi_{1}=\sigma_{1} p_{0}, \pi_{2}=\sigma_{2} p_{0}$
- What if seller 1 has higher minimum price? $\left(p_{L}^{1} \geq p_{0}=p_{L}^{2}\right)$
- Then $p_{L}^{1} \in\left[p_{0}, p_{2}^{H}\right]$, the profit of seller 2 would be written as

$$
p_{L}\left(1-F_{1}\left(p_{L}\right)\right) \alpha_{12}+\alpha_{2} p_{L}=\sigma_{2} p_{L} \geq \sigma_{2} p_{0} \text { (contradiction) }
$$

- Therefore, in the independent case, the minimum price is the same

Figure 12: Independent

## Minimum Price and the Nested Case

- Assume seller 3 has the same minimum price as seller 2
- Since consumers of seller 2 compare seller 3 at the same time, seller 2 can achieve higher profit by lowering the minimum price
- Intuition: In the nested structure, the seller inside faces more elastic demand $\rightarrow$ Lower minimum price

Figure 13: Nested

## Data Cleaning Procedure

Table 14: Number of Observations

| Data cleaning | Number of observation |
| :---: | :---: |
| Total number of postings | 810,585 |
| Postings with memory size | 500,482 |
| Unique postings | 104,173 |
| Sold items | 116,018 |
| With original price | 248,497 |
| Number of Models | 15 |

## Sensitivity to Choice of Groups

- If group the sellers to 5 , compare group 5 and 1 (finer grouping) gives more frequent rejection: Different minimum price

Table 15: Nestedness with Grouping

| Model | 3 group | 5 group |
| :---: | :---: | :---: |
| iPhone X | 1 | 1 |
| iPhone 8 | 1 | 1 |
| iPhone XS | 1 | 0 |
| iPhone XR | 0 | 0 |
| iPhone 11 | 0 | 1 |
| Galaxy A8 | 1 | 0 |
| Galaxy S9 | 1 | 1 |
| Galaxy S10 | 0 | 0 |
| Galaxy J3 | 0 | 1 |
| Galaxy Note8 | 1 | 1 |
| Galaxy Note9 | 0 | 0 |
| Galaxy Note10 | 0 | 0 |

## Platform

- In principle, one item for one posting
- But in practice, sellers are making duplicate posts
- The postings with the same description and characteristics are likely to have the same picture: Same product
- Characteristics: memory, condition, warranty period, seller
- Platform does not allow the use of macro or automatic re-posting
- Platform manages the trade
- Item disappears from the list with flag of "sold" when the item is sold

## Distribution of the Number of Re-Posting

Figure 14: Number of Re-Posting Per Day

## Time Variation of the Group

Table 16: Changes in Group

|  |  | Seller group(in each |  |  |
| :---: | ---: | ---: | ---: | ---: |
|  |  | 1 | 2 | 3 |
|  | 1 | 83,676 | 11,298 | 541 |
| (Time invariant) |  | 87.61 | 11.83 | 0.57 |
| Seller group | 2 | 14,288 | 46,775 | 13,961 |
|  |  | 19.04 | 62.35 | 18.61 |
|  | 3 | 3,826 | 20,203 | 53,929 |
|  |  | 4.91 | 25.92 | 69.18 |

## Homogeneity Assumption

## Market Thickness and Nestedness

- The difference between the nested/ non-nested models
- More sellers in the non-nested models
- In the nested models, more listings are posted within one hour on average

Table 26: Nested and Non-Nested Model

| Variable | Nest |  | Non nest |  | Diff (Non nest-Nest) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mean | SD | Mean | SD | $\beta$ | t |
| G1 frequency | 0.154 | 0.047 | 0.127 | 0.026 | $-0.027^{* * *}$ | $(-92.164)$ |
| G3 frequency | 0.391 | 0.144 | 0.366 | 0.134 | $-0.025^{* * *}$ | $(-22.298)$ |
| Difference (G3-G1) | 0.237 | 0.115 | 0.246 | 0.140 | $0.008^{* * *}$ | $(16.248)$ |
| Sold probability | 0.228 | 0.161 | 0.119 | 0.121 | $-0.109^{* * *}$ | $(-189.675)$ |
| \# G1 sellers | 80.730 | 31.803 | 96.006 | 33.471 | $15.275^{* * *}$ | $(116.654)$ |
| \# G2 sellers | 20.482 | 6.134 | 27.581 | 9.794 | $7.099^{* * *}$ | $(217.299)$ |
| \# G3 sellers | 12.687 | 6.290 | 16.339 | 6.836 | $3.652^{* * *}$ | $(138.633)$ |
| ave. \# postings / hour | 8.572 | 2.751 | 11.738 | 2.901 | $3.166^{* * *}$ | $(279.205)$ |
| Observations | 122171 |  | 126326 |  | 248497 |  |

2nd step testing

## Robustness Check

- Potential endogeneity concerns
(1) Seller with larger inventory
- $\sigma$ constructed based on listing level (e.g., "SKT Galaxy Folder G150 White")
- Still show statistically significant positive coefficient in 5\%, 10\% price.

Inventory story
(2) Price endogeneity

■ Unobserved demand shock

- Price of other models that are posted within the same hour by the seller Price Inst1
- The initial price of repeated listing (with the same description)

## Price Inst2

■ All show similar statistical significance and positive coefficients for 5\%, 10\% price

- Other test results also show similar results - Time lapse, with only professional sellers (who sell more than 5 different models within a month)

## Why it is important?

- Contribution to the literature

■ Giving empirical evidence on the theoretical predictions that were conflicted in the literature

- Practical aspect

■ Used product trading platforms in Korea suffer from the over-posting problem: Some sellers put too many postings.
■ Platform needs to understand why the sellers are over-posting
■ My analysis could be used as evidence to understand seller behavior.

## Model Predictions: Nested

- Predictions from nested structure
(1) The entry of new sellers will not cause changes for a nested case.

Table 28: Pricing after Group 1 Entrants

|  | $\Delta$ Group 1 price(wk) | $\Delta$ Group 2 price(wk) | $\Delta$ Group 3 price(wk) |
| :--- | :--- | :--- | :--- |
